# **Interfaces**

### Problem 1. Define an Interface IPerson

Define an interface **IPerson** with properties for **Name** and **Age**. Define a class **Citizen** which implements **IPerson** and has a constructor which takes a **string** name and an **int** age.

Try to create a new Person like this:

```
string name = Console.ReadLine();
int age = int.Parse(Console.ReadLine());
IPerson person = new Citizen(name, age);
Console.WriteLine(person.Name);
Console.WriteLine(person.Age);
```

### **Examples**

Input	Output
Pesho	Pesho
25	25

## **Problem 2. Multiple Implementation**

Using the code from the previous task, define an interface **Ildentifiable** with a **string** property **Id** and an interface **IBirthable** with a **string** property **Birthdate** and implement them in the **Citizen** class. Rewrite the Citizen constructor to accept the new parameters.

Test your class like this:

```
string name = Console.ReadLine();
int age = int.Parse(Console.ReadLine());
string id = Console.ReadLine();
string birthdate = Console.ReadLine();
IIdentifiable identifiable = new Citizen(name, age,id, birthdate);
IBirthable birthable = new Citizen(name, age, id, birthdate);
Console.WriteLine(identifiable.Id);
Console.WriteLine(birthable.Birthdate);
```

Input	Output
Pesho	9105152287
25	15/05/1991
9105152287	
15/05/1991	

#### Problem 3. Ferrari

Model an application which contains a **class Ferrari** and an **interface**. Your task is simple, you have a **car - Ferrari**, its model is **"488-Spider"** and it has a **driver**. Your Ferrari should have functionality to **use brakes** and **push the gas pedal**. When the **brakes** are pushed down **print "Brakes!"**, and when the **gas pedal** is pushed down - **"Zadu6avam sA!"**. As you may have guessed this functionality is typical for all cars, so you should **implement an interface** to describe it.

Your task is to **create a Ferrari** and **set the driver's name** to the passed one in the input. After that, print the info. Take a look at the Examples to understand the task better.

### Input

On the single input line, you will be given the driver's name.

### **Output**

On the **single output line**, print the model, the messages from the brakes and gas pedal methods and the driver's name. In the following format:

<model>/<brakes>/<gas pedal>/<driver's name>

#### **Constraints**

The input will always be valid, no need to check it explicitly! The Driver's name may contain any ASCII characters.

### **Example**

Input	Output
Bat Giorgi	488-Spider/Brakes!/Zadu6avam sA!/Bat Giorgi
Dinko	488-Spider/Brakes!/Zadu6avam sA!/Dinko

# **Problem 4. Telephony**

You have a business - manufacturing cell phones. But you have no software developers, so you call some friends of yours and ask them to help you create a cell phone software. They have already agreed and you started working on the project. The project consists of one main model – a Smartphone. Each of your smartphones should have functionalities of calling other phones and browsing in the world wide web.

These friends of yours though are very busy, so you decide to write the code on your own. Here is the mandatory assignment:

You should have a **model** - **Smartphone** and two separate functionalities which your smartphone has - to **call other phones** and to **browse in the world wide web**. You should end up with **one class** and **two interfaces**.

### Input

The input comes from the console. It will hold two lines:

- First line: phone numbers to call (string), separated by spaces.
- Second line: sites to visit (string), separated by spaces.

#### **Output**

• First call all numbers in the order of input then browse all sites in order of input

 The functionality of calling phones is printing on the console the number which are being called in the format:

Calling... < number>

• The functionality of the browser should print on the console the site in format:

Browsing: <site>!

- If there is a number in the input of the URLs, print: "Invalid URL!" and continue printing the rest of the URLs.
- If there is a character different from a digit in a number, print: "Invalid number!" and continue to the next number.

#### **Constraints**

• Each site's URL should consist only of letters and symbols (No digits are allowed in the URL address)

### **Examples**

Input	Output
0882134215 0882134333 08992134215 0558123 3333 1	Calling 0882134215
http://softuni.bg http://youtube.com http://www.g00gle.com	Calling 0882134333
	Calling 08992134215
	Calling 0558123
	Calling 3333
	Calling 1
	Browsing: http://softuni.bg!
	Browsing: http://youtube.com!
	Invalid URL!

## **Problem 5. Border Control**

It's the future, you're the ruler of a totalitarian dystopian society inhabited by **citizens** and **robots**, since you're afraid of rebellions you decide to implement strict control of who enters your city. Your soldiers check the **Id**s of everyone who enters and leaves.

You will receive an unknown amount of lines from the console until the command "End" is received, on each line there will be a piece of information for either a citizen or a robot who tries to enter your city in the format "<name> <age> <id>" for citizens and "<model> <id>" for robots. After the end command on the next line you will receive a single number representing the last digits of fake ids, all citizens or robots whose Id ends with the specified digits must be detained.

The output of your program should consist of all detained **Id**s each on a separate line (the order of printing doesn't matter).

### Input

The input comes from the console. Every commands' parameters before the command "End" will be separated by a single space.

Input	Output
Pesho 22 9010101122	9010101122
MK-13 558833251	33283122

MK-12 33283122 End 122	
Toncho 31 7801211340 Penka 29 8007181534 IV-228 999999 Stamat 54 3401018380 KKK-666 80808080 End 340	7801211340

## **Problem 6. Birthday Celebrations**

It is a well known fact that people celebrate birthdays, it is also known that some people also celebrate their pets' birthdays. Extend the program from your last task to add **birthdates** to citizens and include a class **Pet**, pets have a **name** and a **birthdate**. Encompass repeated functionality into interfaces and implement them in your classes.

You will receive from the console an unknown amount of lines. Until the command "End" is received, each line will contain information in one of the following formats "Citizen <name> <age> <id> <bir> <bir> <model> <id>" for robots or "Pet <name> <birthdate>" for pets. After the "End" command on the next line you will receive a single number representing a specific year, your task is to print all birthdates (of both citizens and pets) in that year in the format day/month/year (the order of printing doesn't matter).

Input	Output
Citizen Pesho 22 9010101122 10/10/1990	10/10/1990
Pet Sharo 13/11/2005	
Robot MK-13 558833251	
End	
1990	
Citizen Stamat 16 0041018380 01/01/2000	01/01/2000
Robot MK-10 12345678	24/12/2000
Robot PP-09 00000001	
Pet Topcho 24/12/2000	
Pet Kosmat 12/06/2002	
End	
2000	
Robot VV-XYZ 11213141	<empty output=""></empty>
Citizen Penka 35 7903210713 21/03/1979	
Citizen Kane 40 7409073566 07/09/1974	
End	
1975	

## **Problem 7. Food Shortage**

Your totalitarian dystopian society suffers a shortage of food, so many rebels appear. Extend the code from your previous task with new functionality to solve this task.

Define a class **Rebel** which has a **name**, **age** and **group** (string), names are **unique** - there will never be 2 Rebels/Citizens or a Rebel and Citizen with the same name. Define an interface **IBuyer** which defines a method **BuyFood()** and an integer property **Food**. Implement the **IBuyer** interface in the **Citizen** and **Rebel** class, both Rebels and Citizens **start with 0 food**, when a Rebel buys food his **Food** increases by **5**, when a Citizen buys food his **Food** increases by **10**.

On the first line of the input you will receive an integer **N** - the number of people, on each of the next **N** lines you will receive information in one of the following formats "<name> <age> <id> <birthdate>" for a Citizen or "<name> <age> <group>" for a Rebel. After the **N** lines until the command "End" is received, you will receive names of people who bought food, each on a new line. Note that not all names may be valid, in case of an incorrect name - nothing should happen.

### Output

The **output** consists of only **one line** on which you should print the **total** amount of food purchased.

### **Examples**

Input	Output
2	20
Pesho 25 8904041303 04/04/1989	
Stancho 27 WildMonkeys	
Pesho	
Gosho	
Pesho	
End	
4	20
Stamat 23 TheSwarm	
Toncho 44 7308185527 18/08/1973	
Joro 31 Terrorists	
Penka 27 881222212 22/12/1988	
Jiraf	
Jo ro	
Jiraf	
Joro	
Stamat	
Penka	
End	

# **Problem 8. Military Elite**

Create the following class hierarchy:

Soldier – general class for soldiers, holding id, first name and last name.

- o **Private** lowest base soldier type, holding the field **salary**(double).
  - LeutenantGeneral holds a set of Privates under his command.
  - **SpecialisedSoldier** general class for all specialised soldiers holds the **corps** of the soldier. The corps can only be one of the following: **Airforces** or **Marines**.
    - Engineer holds a set of repairs. A repair holds a part name and hours worked(int).
    - Commando holds a set of missions. A mission holds code name and a state (inProgress or Finished). A mission can be finished through the method CompleteMission().
- o **Spy** holds the **code number** of the spy (int).

Extract **interfaces** for each class. (e.g. **ISoldier**, **IPrivate**, **ILeutenantGeneral**, etc.) The interfaces should hold their public properties and methods (e.g. **Isoldier** should hold **id**, **first name** and **last name**). Each class should implement its respective interface. Validate the input where necessary (corps, mission state) - input should match **exactly** one of the required values, otherwise it should be treated as **invalid**. In case of **invalid corps** the entire line should be skipped, in case of an **invalid mission state** only the mission should be skipped.

You will receive from the console an unknown amount of lines containing information about soldiers until the command "**End**" is received. The information will be in one of the following formats:

- Private: "Private <id> <firstName> <lastName> <salary>"
- LeutenantGeneral: "LeutenantGeneral <id> <firstName> <lastName> <salary> <private1Id> <private2Id> ... <privateNId>" where privateXId will always be an Id of a private already received through the input.
- Engineer: "Engineer <id> <firstName> <lastName> <salary> <corps> <repair1Part> <repair1Hours> ... <repairNPart> <repairNHours>" where repairXPart is the name of a repaired part and repairXHours the hours it took to repair it (the two parameters will always come paired).
- Commando: "Commando <id> <firstName> <lastName> <salary> <corps> <mission1CodeName> <mission1state> ... <missionNCodeName> <missionNstate>" a missions cde name, description and state will always come together.
- Spy: "Spy <id> <firstName> <lastName> <codeNumber>"

<repair1 ToString()>

Define proper constructors. Avoid code duplication through abstraction. Override **ToString()** in all classes to print detailed information about the object.

**NOTE:** Salary should be printed rounded to **two decimal places** after the separator.

Code Name: <codeName> State: <state>

## **Examples**

Mission:

Input	Output
Private 1 Pesho Peshev 22.22 Commando 13 Stamat Stamov 13.1 Airforces Private 222 Toncho Tonchev 80.08 LeutenantGeneral 3 Joro Jorev 100 222 1 End	Name: Pesho Peshev Id: 1 Salary: 22.22 Name: Stamat Stamov Id: 13 Salary: 13.10 Corps: Airforces Missions: Name: Toncho Tonchev Id: 222 Salary: 80.08 Name: Joro Jorev Id: 3 Salary: 100.00 Privates: Name: Toncho Tonchev Id: 222 Salary: 80.08 Name: Pesho Peshev Id: 1 Salary: 22.22
Engineer 7 Pencho Penchev 12.23 Marines Boat 2 Crane 17 Commando 19 Penka Ivanova 150.15 Airforces HairyFoot finished Freedom inProgress End	Name: Pencho Penchev Id: 7 Salary: 12.23 Corps: Marines Repairs:    Part Name: Boat Hours Worked: 2    Part Name: Crane Hours Worked: 17 Name: Penka Ivanova Id: 19 Salary: 150.15 Corps: Airforces Missions:    Code Name: Freedom State: inProgress

## **Problem 9. \*Collection Hierarchy**

Create 3 different string collections – AddCollection, AddRemoveCollection and MyList.

The AddCollection should have:

• Only a single method **Add** which adds an item to the **end** of the collection.

The AddRemoveCollection should have:

- An **Add** method which adds an item to the **start** of the collection.
- A **Remove** method which removes the **last** item in the collection.

The MyList collection should have:

- An **Add** method which adds an item to the **start** of the collection.
- A **Remove** method which removes the **first** element in the collection.
- A Used property which displays the number of elements currently in the collection.

Create interfaces which define the collections functionality, think how to model the relations between interfaces to reuse code. Add an extra bit of functionality to the methods in the custom collections, **add** methods should return the index in which the item was added, **remove** methods should return the item that was removed.

Your task is to create a single copy of your collections, after which on the first input line you will receive a random amount of strings in a single line separated by spaces - the elements you must add to each of your collections. For each of your collections write a single line in the output that holds the results of all **Add operations** separated by spaces (check the examples to better understand the format). On the second input line, you will receive a single number - the amount of **Remove operations** you have to call on each collection. In the same manner, as with the Add operations for each collection (except the AddCollection), print a line with the results of each Remove operation separated by spaces.

### Input

The input comes from the console. It will hold two lines:

- The first line will contain a random amount of strings separated by spaces the elements you have to Add to
  each of your collections.
- The second line will contain a single number the amount of Remove operations.

### Output

The output will consist of 5 lines:

- The first line contains the results of all Add operations on the AddCollection separated by spaces.
- The second line contains the results of all Add operations on the AddRemoveCollection separated by spaces.
- The third line contains the result of all Add operations on the MyList collection separated by spaces.
- The fourth line contains the result of all **Remove** operations on the **AddRemoveCollection** separated by spaces.
- The fifth line contains the result of all Remove operations on the MyList collection separated by spaces.

### **Constraints**

- All collections should have a length of 100.
- There will never be more than 100 add operations.
- The number of remove operations will never be more than the amount of add operations.

Input	Output
banichka boza tutmanik	0 1 2
3	0 0 0

	0 0 0 banichka boza tutmanik tutmanik boza banichka
one two three four five six seven 4	0 1 2 3 4 5 6 0 0 0 0 0 0 0 0 0 0 0 0 0 one two three four seven six five four

#### Hint

Create an interface hierarchy representing the collections. You can use a List as the underlying collection and implement the methods using the List's Add, Remove and Insert methods.

# **Problem 10.\*Explicit Interfaces**

Create 2 interfaces IResident and IPerson. IResident should have a name, country and a method GetName(). IPerson should have a name, an age and a method GetName(). Create a class Citizen which implements both IResident and IPerson, explicitly declare that IResident's GetName() method should return "Mr/Ms/Mrs" before the name while IPerson's GetName() method should return just the name. You will receive lines of citizen information from the console until the command "End" is received. Each will be in the format "<name> <country> <age>" for each line create the corresponding citizen and print his IPerson's GetName() and his IResitent's GetName().

## **Examples**

Input	Output
PeshoPeshev Bulgaria 20	PeshoPeshev
End	Mr/Ms/Mrs PeshoPeshev
JoroJorev Bulgaria 33	JoroJorev
EricAnderson GreatBritain 28	Mr/Ms/Mrs JoroJorev
PeterArmstrong USA 19	EricAnderson
End	Mr/Ms/Mrs EricAnderson
	PeterArmstrong
	Mr/Ms/Mrs PeterArmstrong

#### Hint

Check online about Explicit Interface Implementation.
